PHASE 1 – BRAINSTORMING & IDEATION

Project Title

Auto Ticket Classification using Flow Designer

1. Introduction

The school IT helpdesk receives multiple incident requests every day from students and teachers. These requests may be related to **Wi-Fi issues, projector failures, password problems, and slow computers**.

Currently, IT staff manually review each support request and identify the appropriate category and subcategory. This manual process requires additional time and can become inefficient when the number of support requests increases.

The proposed project, **"Auto Ticket Classification using Flow Designer,"** aims to automate the classification of IT support tickets using **ServiceNow Flow Designer**. The system analyzes keywords in the ticket's short description and automatically assigns the appropriate category and subcategory.

2. Problem Identification

The existing manual ticket classification process creates several difficulties for the school IT helpdesk:

- IT staff need to manually review each ticket.
- The correct category and subcategory must be selected manually.
- Manual classification takes additional time.
- Increasing numbers of support requests can make the process difficult to manage efficiently.
- Manual classification can result in inconsistent ticket categorization.

The project therefore identifies the need for an automated and standardized ticket classification process.

3. Proposed Project Idea

The proposed idea is to create an automated ticket classification system using **ServiceNow Flow Designer**.

When a student or teacher creates an IT support ticket, the system examines the issue description for predefined keywords. Based on the identified keyword, the Flow Designer automation automatically assigns the appropriate **Category** and **Subcategory**.

For example:

Ticket Issue	Category	Subcategory
WiFi not working	Network	Wi-Fi
Projector not turning on	Hardware	Projector
Forgot password	Access	Forgot Password
Slow computer	Performance	Slow Computer

The project document describes this keyword-based classification approach using Flow Designer.

4. Project Objectives

The main objectives of the project are:

1. **Automatically classify incidents at the time of creation.**
2. **Reduce manual effort for IT agents.**
3. **Improve ticket routing efficiency.**
4. **Implement a no-code and easily maintainable solution.**
5. Automatically assign the appropriate **Category and Subcategory**.
6. Provide an automated email notification to the caller after ticket creation.

5. Brainstormed Solution

During the ideation stage, the project focuses on automating the repetitive task of ticket classification.

The proposed workflow is:

Student/Teacher creates IT ticket
↓
System receives the ticket
↓
Flow Designer checks the short description
↓
Keyword is identified
↓
Category is automatically assigned
↓
Subcategory is automatically assigned
↓
Email notification is sent to the caller

This approach is intended to reduce manual classification and provide a structured ticket management process.

6. Key Features Identified

The following features were identified during the brainstorming stage:

- Automatic ticket classification.
- Category assignment.
- Subcategory assignment.
- Dependent choice between Category and Subcategory.
- Keyword-based classification.
- Automated email notification.
- Structured ticket information.
- No-code implementation using Flow Designer.
- Maintainable and scalable design.

7. Expected Benefits

The proposed system is expected to provide the following benefits:

- Reduces manual effort for IT staff.
- Saves time during ticket classification.
- Provides consistent categorization.
- Improves ticket routing efficiency.
- Reduces errors caused by manual classification.
- Provides automatic confirmation to the caller.
- Provides a solution that can be maintained and extended using Flow Designer.

8. Initial Project Scope

The initial project focuses on automatically classifying common school IT support issues such as:

- **Network issues** – Wi-Fi
- **Hardware issues** – Projector
- **Access issues** – Forgot Password
- **Performance issues** – Slow Computer

The project also includes automatic email notification after ticket creation.

9. Conclusion

The brainstorming and ideation stage identified the need for an automated solution for classifying school IT helpdesk tickets. The proposed **Auto Ticket Classification using Flow Designer** project uses ServiceNow Flow Designer to analyze ticket descriptions and automatically assign appropriate categories and subcategories.

The idea focuses on reducing manual work, improving ticket classification, and providing a maintainable no-code automation solution for the school IT helpdesk.
