PHASE 3 – PROJECT DESIGN

Project Title

Auto Ticket Classification using Flow Designer

1. Introduction

The Project Design phase defines the structure and design of the **Auto Ticket Classification using Flow Designer** project.

The design includes the custom table used to store ticket records, the required fields and their data types, the relationship between Category and Subcategory, and the Flow Designer logic used for automatic ticket classification.

2. System Design

The proposed system is designed to automatically classify school IT support tickets.

The basic design is:

Ticket Created
↓
Flow Designer Triggered
↓
Check Short Description
↓
Identify Issue
↓
Assign Category
↓
Assign Subcategory
↓
Send Email Notification

The Flow Designer is configured to start when a new record is created and when the Category field is empty.

3. Custom Table Design

A custom table named **Incident WorkFlow** is designed to store the school IT ticket records.

The table is created through:

All → Tables → System Definition → Tables → New

The table label is:

Incident WorkFlow

The **Create module** option is unchecked, and Auto Number is enabled for the table.

4. Field Design

The custom table is designed with the following fields:

Field Label	Type	Reference / Choice
Number	Auto Number	—
Caller	Reference	sys_user
Category	Choice	Network, Hardware, Access, Performance
Subcategory	Choice	Wi-Fi, Projector, Forgot Password, Slow Compter
Short Description	String	—
Description	String	—
State	Choice	New, In progress, On hold, Resolved, Closed
Assigned Group	Reference	sys_user_group
Assigned to	Reference	sys_user

These fields provide the structure required to store ticket information.

5. Category Design

The **Category** field is designed as a Choice field.

The available categories are:

- Network
- Hardware
- Access
- Performance

These categories are used by the Flow Designer to classify the ticket according to the issue described in the Short Description.

6. Subcategory Design

The **Subcategory** field is also designed as a Choice field.

The available subcategories are:

- Wi-Fi
- Projector
- Forgot Password
- Slow Compter

The Subcategory field is designed to work as a dependent field based on Category

7. Category and Subcategory Dependency Design

A dependency relationship is designed between **Category** and **Subcategory**.

The Subcategory options dynamically depend on the selected Category.

The designed mapping is:

Category	Subcategory
Network	Wi-Fi
Hardware	Projector
Access	Forgot password
Performance	Slow computer

The project document specifies configuring Subcategory as a dependent field and selecting Category in the **Dependent on** field.

8. State Field Design

The **State** field is designed as a Choice field with the following values:

- New
- In progress
- On hold
- Resolved
- Closed

This provides structured values for representing the status of a ticket.

9. Flow Designer Design

The automation is designed using **ServiceNow Flow Designer**.

Flow Name

Auto Classify School IT Tickets

Application

Global

The flow is created through Flow Designer and then built using the required trigger, conditions, and actions.

10. Flow Trigger Design

The Flow Designer trigger is designed as:

Trigger: Record Created

Table: Incident Workflow

Condition: Category is Empty

After the trigger is configured, the flow uses Flow Logic to perform the classification.

11. Automatic Classification Design

The flow uses the **Short Description** field to identify the type of issue.

The classification design is:

Issue identified in Short Description	Category	Subcategory
Wi-Fi / Network	Network	Wi-Fi
Projector	Hardware	Projector
Forgot password	Access	Forgot Password
Slow Computer	Performance	Slow computer

The Flow Designer uses conditions and Update Record actions for these classifications.

12. Wi-Fi Classification Design

For a Wi-Fi or Network-related issue:

Short Description contains Wi-Fi or Network

↓

Category = Network

↓

Subcategory = Wi-Fi

The flow then updates the ticket record with these values.

13. Projector Classification Design

For a projector-related issue:

Short Description contains Projector

↓

Category = Hardware

↓

Subcategory = Projector

The flow updates the ticket record with the corresponding values.

14. Password Classification Design

For a password-related issue:

Short Description contains Forgot password

↓

Category = Access

↓

Subcategory = Forgot Password

The flow updates the ticket record with the corresponding classification.

15. Slow Computer Classification Design

For a slow computer issue:

Short Description contains Slow Computer

↓

Category = Performance

↓

Subcategory = Slow computer

The flow updates the ticket record with the corresponding classification.

16. Email Notification Design

After the ticket classification process, the system is designed to send an email notification to the caller.

The email action is configured as:

Action: Send Email

To: Caller → Email

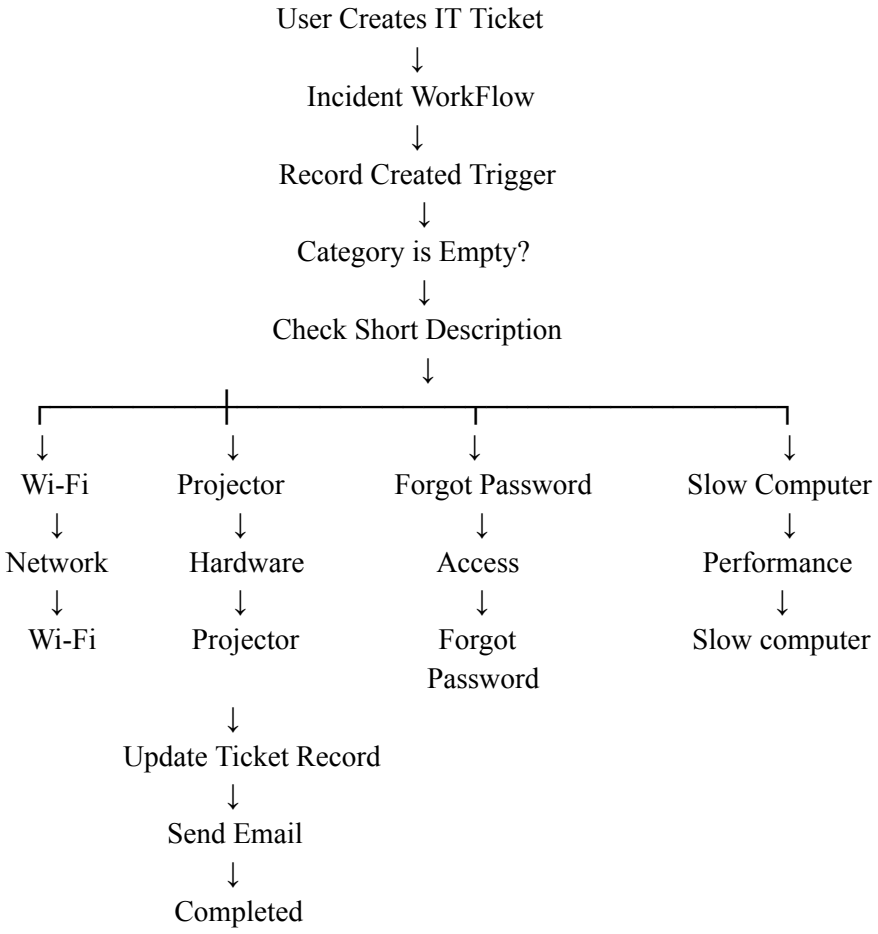

Subject:
Your Request for the issue has been submitted.

Body:
Ticket confirmation message.

This provides confirmation to the caller after the ticket is submitted.

17. Overall Project Design

The overall design of the system can be represented as:

18. Design Outcome

The Project Design phase establishes:

- Custom **Incident WorkFlow** table
- Required ticket fields
- Category choices
- Subcategory choices
- State choices

- Category–Subcategory dependency
- Flow Designer trigger
- Automatic classification conditions
- Update Record actions
- Email notification action

These design elements form the structure required for the development of the project.

19. Conclusion

The Project Design phase defines how the **Auto Ticket Classification using Flow Designer** system will be structured and how its major components will work together.

The design includes the custom ticket table, required fields, dependent Category and Subcategory choices, Flow Designer classification logic, and automated email notification.

This design will be used as the foundation for the **Project Development phase**, where the actual ServiceNow configuration will be performed.
