PHASE 5 – PROJECT DEVELOPMENT

Project Title

Auto Ticket Classification using Flow Designer

1. Introduction

The Project Development phase describes the actual development and configuration activities required to implement the **Auto Ticket Classification using Flow Designer** project in ServiceNow.

The development includes creating the Update Set, creating the custom **Incident WorkFlow** table, configuring fields and choices, implementing the Category and Subcategory dependency, creating the Flow Designer automation, and configuring email notification.

2. Development Objective

The main objective of this phase is to develop the planned system in ServiceNow so that IT support tickets can be automatically classified based on their Short Description.

The system is designed to:

- Store IT ticket records.
- Automatically identify common IT issues.
- Assign Category and Subcategory.
- Use dependent choices.
- Send an email notification to the caller.
- Provide a no-code automation using Flow Designer.

The project document describes the solution as a no-code Flow Designer implementation that is intended to be maintainable and scalable.

3. Development Activity 1 – Create Update Set

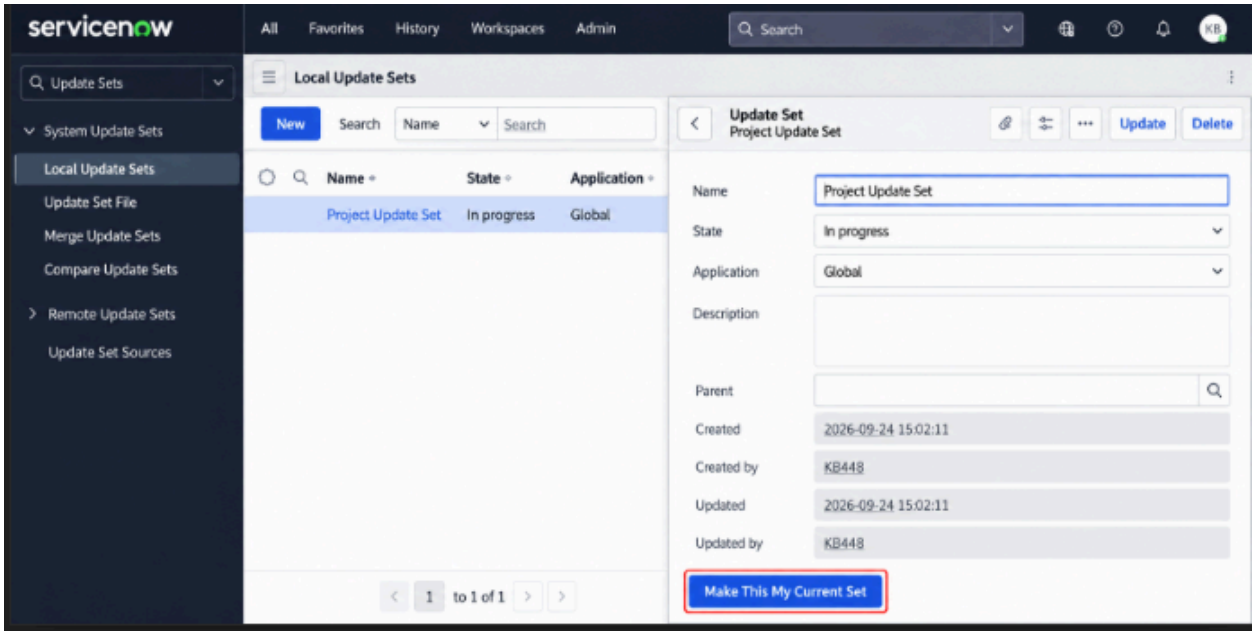

The first development activity is to create an Update Set.

Update Set Details

Name: `Project Update Set`

State: `In progress`

Application: `Global`

Project Update Set created for the project

After saving the Update Set, it is made the current Update Set using the **Make This My Current Set** option.

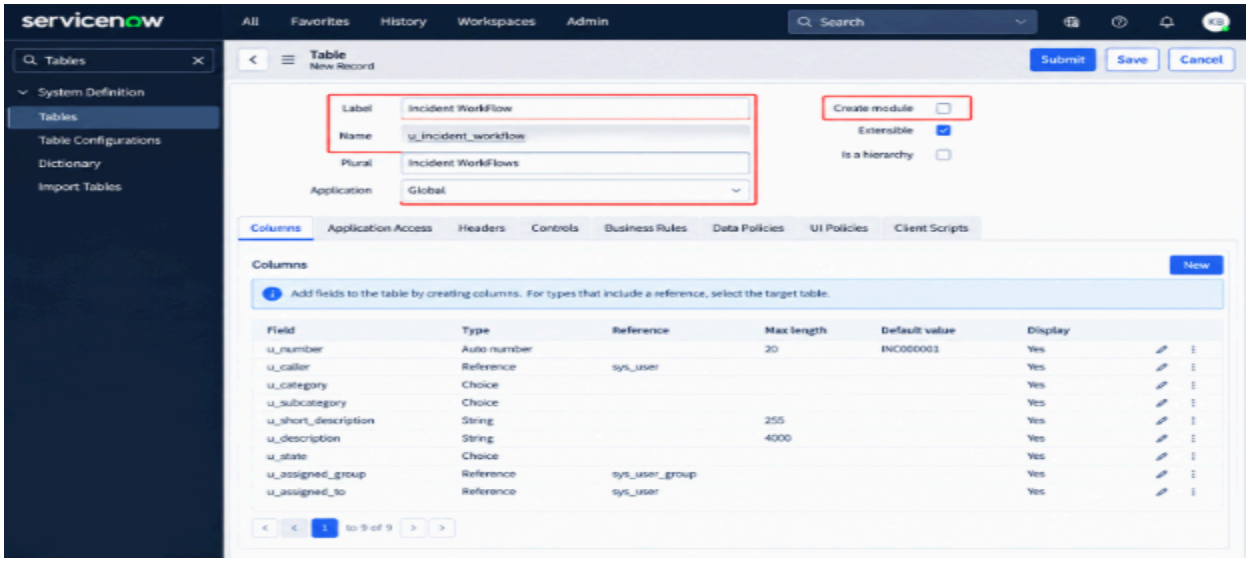

4. Development Activity 2 – Create Custom Table

A custom table is created to store the school IT ticket records.

Table Details

Label: `Incident WorkFlow`

The **Create module** option is unchecked.

Incident WorkFlow custom table configuration

After creating the table, **Auto Number** is enabled through the Controls section.

5. Development Activity 3 – Create Ticket Fields

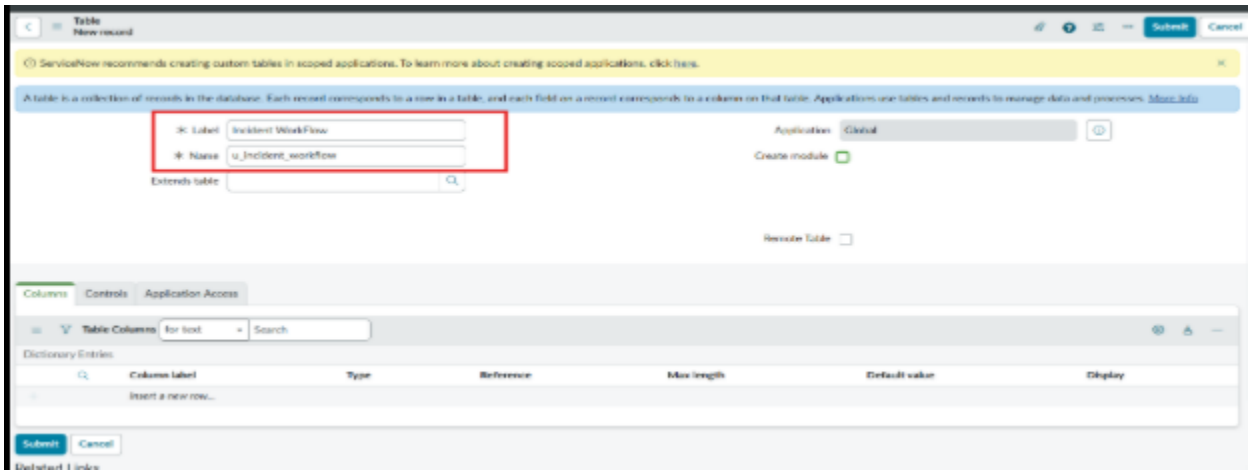

The required fields are created in the **Incident WorkFlow** table.

The fields are:

Field	Type
Number	Auto Number
Caller	Reference
Category	Choice
Subcategory	Choice
Short Description	String
Description	String
State	Choice
Assigned Group	Reference
Assigned to	Reference

The reference fields use the specified tables:

- Caller → `sys_user`
- Assigned Group → `sys_user_group`
- Assigned to → `sys_user`

6. Development Activity 4 – Configure Choices

Choice values are added to the Category, Subcategory, and State fields.

Category

- Network
- Hardware
- Access
- Performance

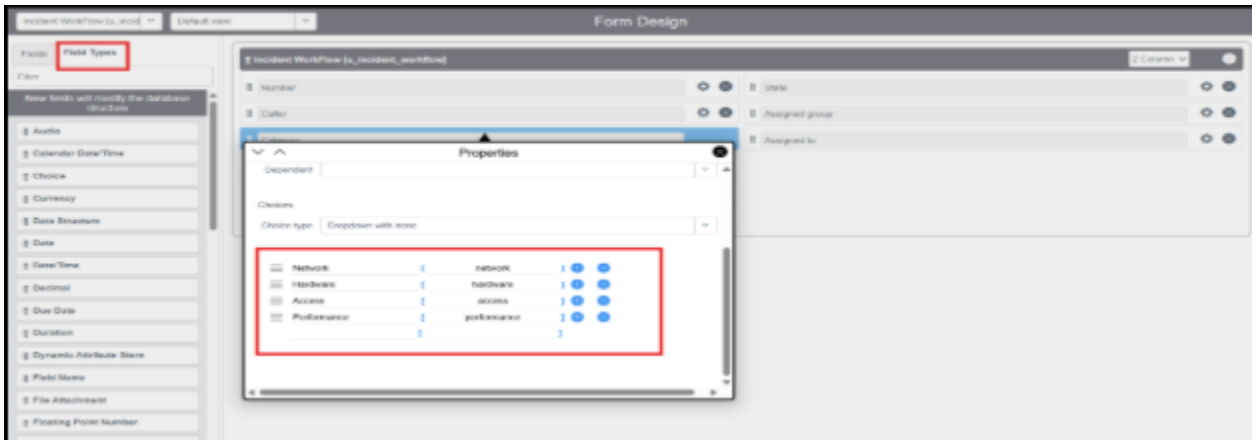

Subcategory

- Wi-Fi
- Projector
- Forgot Password
- Slow Compter

State

- New
- In progress
- On hold
- Resolved
- Closed

These choices provide structured values for the ticket records.

7. Development Activity 5 – Configure Dependent Fields

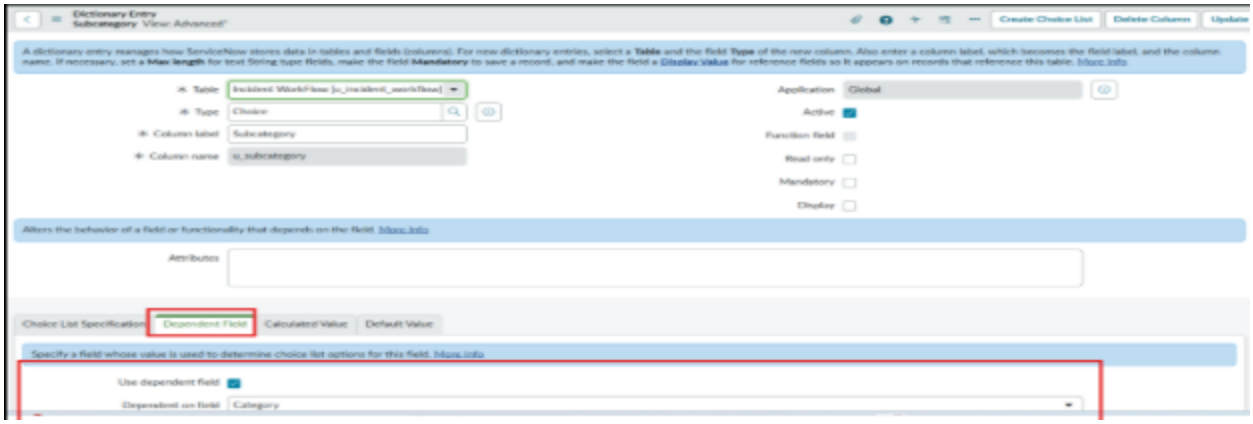

The **Subcategory** field is configured as a dependent field.

The dependency is created by selecting **Category** in the **Dependent on** field.

The configured relationships are:

Subcategory	Category
Wi-Fi	Network
Projector	Hardware
Forgot password	Access
Slow computer	Performance

This allows the Subcategory choices to be displayed according to the selected Category.

8. Development Activity 6 – Create Flow Designer Flow

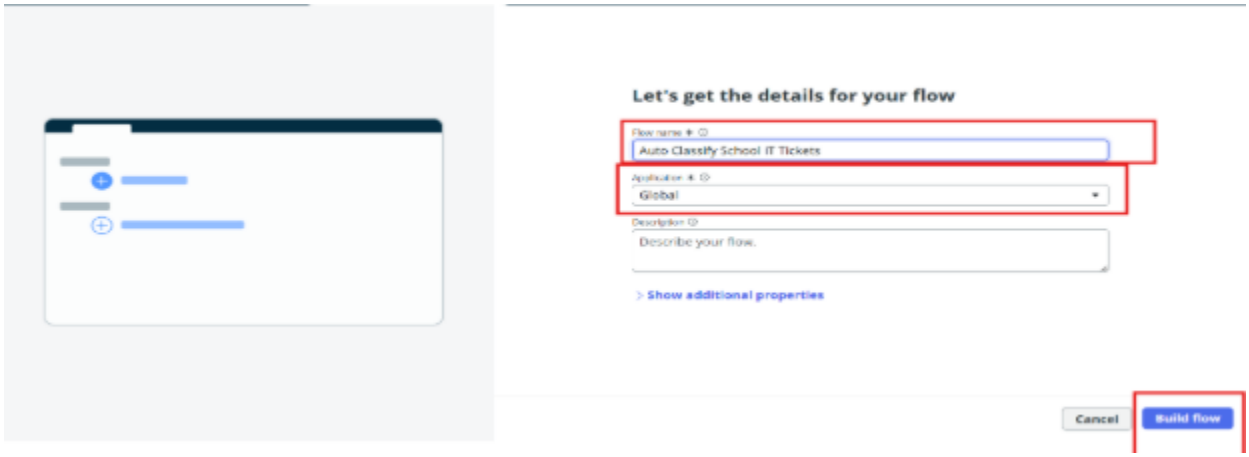

The automatic classification flow is created using ServiceNow Flow Designer.

Flow Details

Flow Name: `Auto Classify School IT Tickets`

Application: `Global`

The flow is created and built using Flow Designer.

9. Development Activity 7 – Configure Trigger

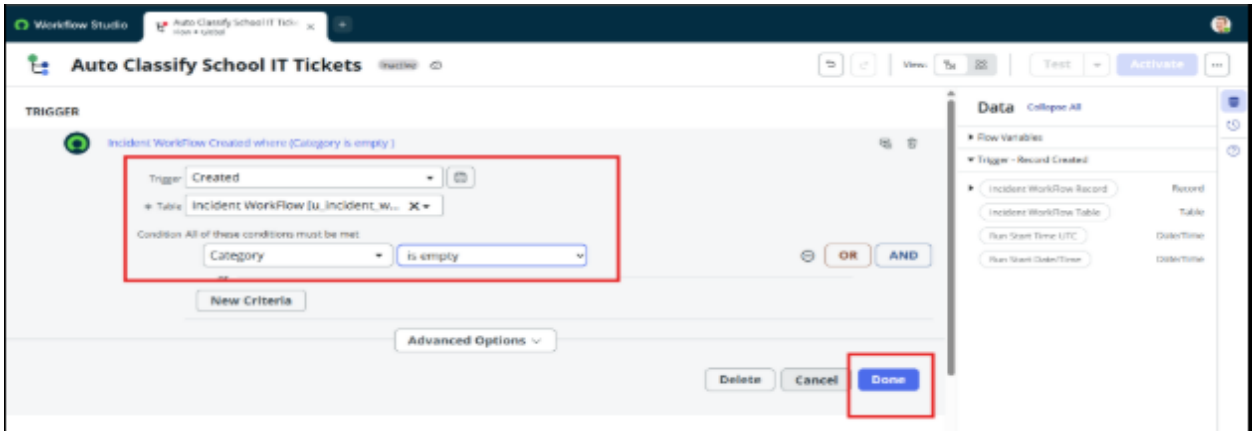

The flow trigger is configured as:

Trigger: Record Created

Table: Incident Workflow

Condition: Category is Empty

After configuring the trigger, the flow uses **Flow Logic** to perform automatic classification.

10. Development Activity 8 – Configure Wi-Fi Classification

An **If Condition** is created for Wi-Fi or Network-related issues.

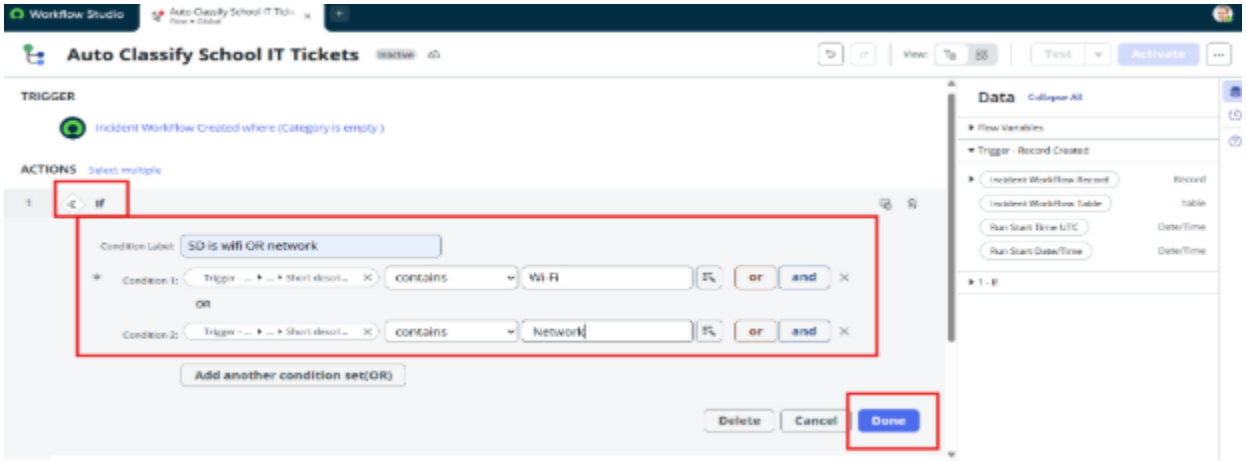

The Short Description is checked for the relevant keywords.

When the condition is satisfied:

Category = Network

Subcategory = Wi-Fi

An Update Record action is used to save these values to the ticket.

11. Development Activity 9 – Configure Projector Classification

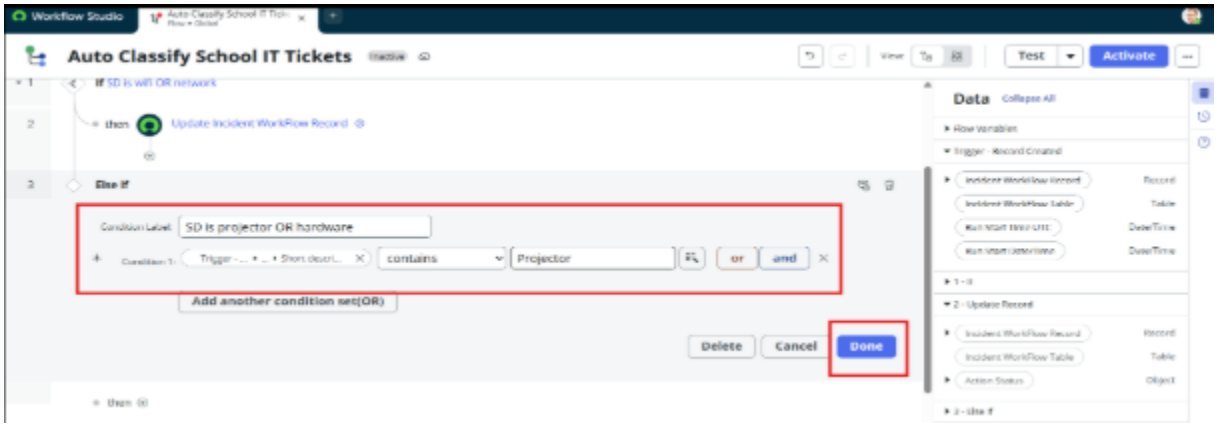

An **Else If Condition** is created for projector-related issues.

When the Short Description contains the specified projector keyword:

Category = Hardware

Subcategory = Projector

The ticket record is updated with these values.

12. Development Activity 10 – Configure Password Classification

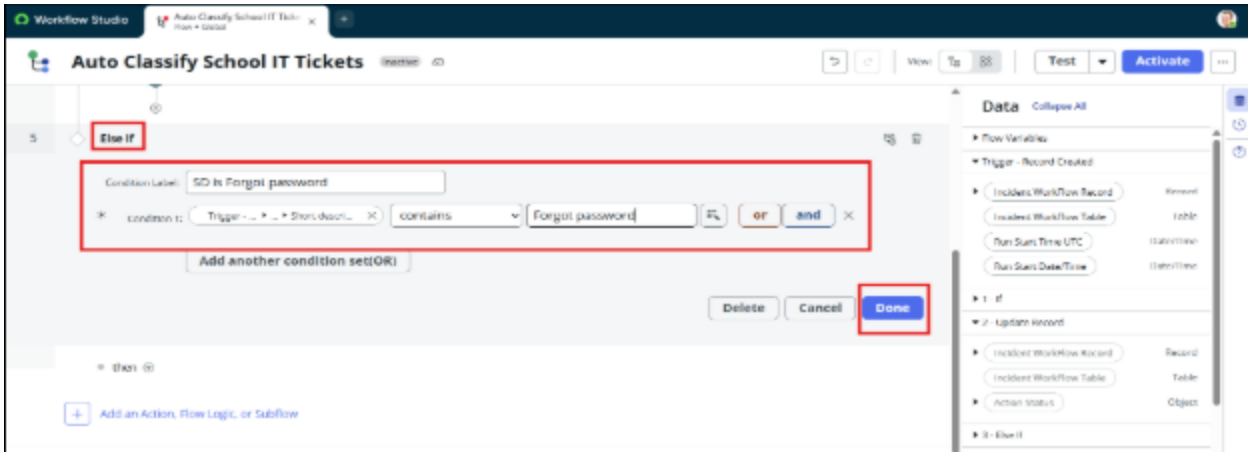

Another **Else If Condition** is created for password-related issues.

When the Short Description contains **Forgot password**:

Category = Access

Subcategory = Forgot Password

The ticket record is then updated with these values.

13. Development Activity 11 – Configure Slow Computer Classification

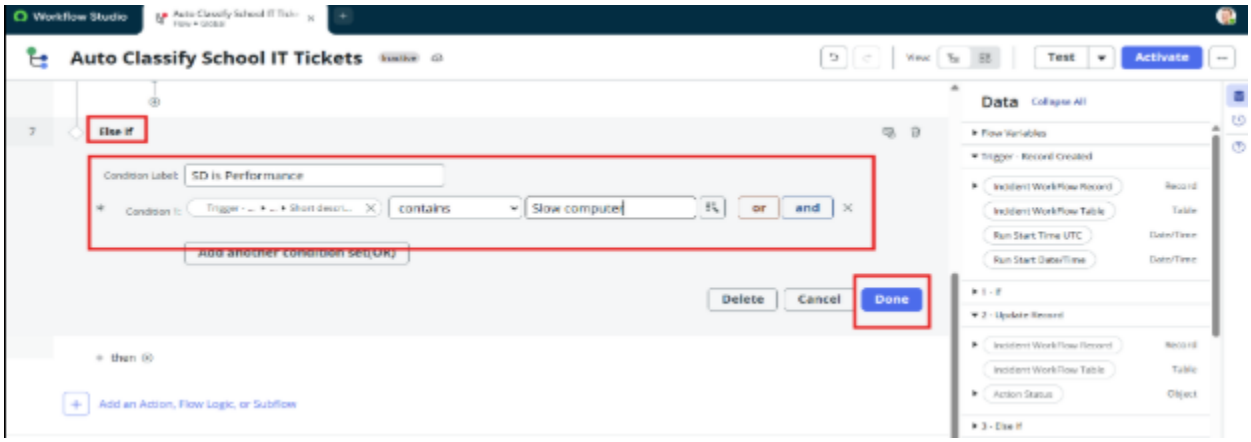

Another **Else If Condition** is created for slow computer issues.

When the Short Description contains **Slow Computer**:

Category = Performance

Subcategory = Slow computer

The ticket record is updated with these values.

14. Development Activity 12 – Configure Email Notification

After the ticket classification, an email notification is configured using the **Send Email** action.

Email Configuration

To: Caller → Email

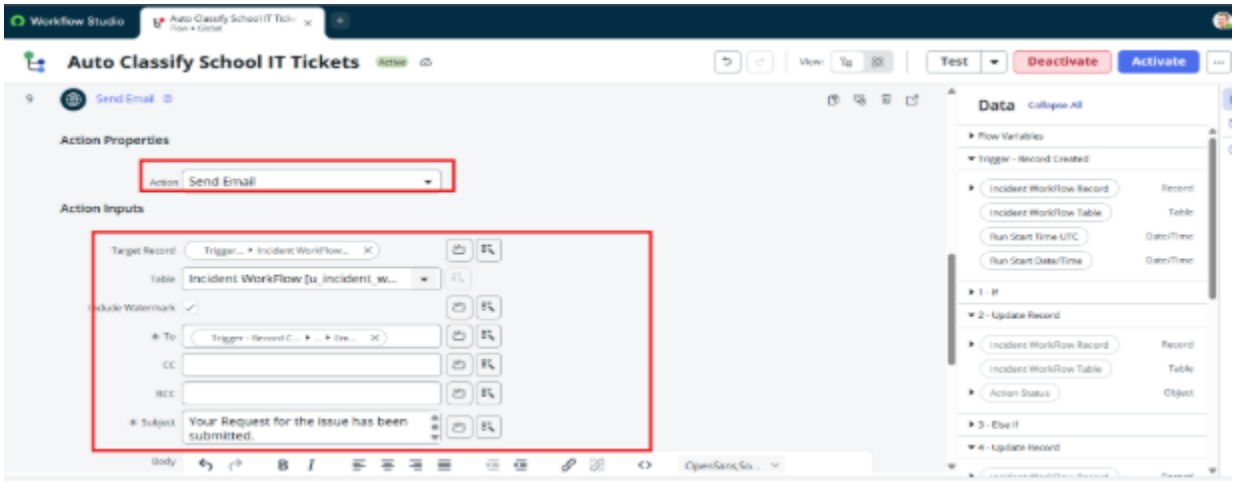

Subject:

```
Your Request for the issue has been submitted.
```

Body:

Ticket confirmation message.

This provides an email confirmation to the caller after the ticket is created.

15. Complete Development Flow

The developed solution follows this process:

Create IT Ticket
↓
Record Created
↓
Check Category
↓
Read Short Description
↓
Identify Issue

↓
Assign Category
↓
Assign Subcategory
↓
Update Ticket Record
↓
Send Email Notification
↓
Ticket Classification Completed

16. Development Outcome

After completing the development activities, the ServiceNow solution contains:

- Project Update Set
- Incident WorkFlow custom table
- Required ticket fields
- Category choices
- Subcategory choices
- State choices
- Category/Subcategory dependency
- Auto Classify School IT Tickets flow
- Automatic classification conditions
- Update Record actions
- Email notification action

These development components are based on the activities described in the supplied project document.

17. Conclusion

The Project Development phase implements the design of the **Auto Ticket Classification using Flow Designer** project.

The custom ticket table and required fields are created, dependent choices are configured, and Flow Designer is used to automatically classify IT tickets according to their Short Description. An email notification is also configured for the caller.

The completed development will then proceed to the **Project Testing phase**, where the classification and notification functions will be tested.
