PHASE 6 – PROJECT TESTING

Project Title

Auto Ticket Classification using Flow Designer

---

1. Introduction

The Project Testing phase is used to verify that the developed **Auto Ticket Classification using Flow Designer** solution works as expected.

The objective of this phase is to validate the end-to-end automation, confirm data accuracy, and check that the developed solution meets the required functional requirements.

---

2. Testing Objectives

The main objectives of testing are:

1. Verify that the ticket can be created successfully.
2. Verify that Category is automatically assigned.
3. Verify that Subcategory is automatically assigned.
4. Verify that the correct values are stored in the ticket.
5. Verify that the email notification is sent to the caller.
6. Validate the ticket data.
7. Confirm that the automation works for different types of IT issues.

---

3. Data Validation Checks

The following data validation checks are performed:

- Mandatory fields are captured correctly.
- Auto-number is generated without duplication.
- Category and Subcategory values are stored accurately.
- Reference fields resolve correctly to the user and group tables.

4. Test Scenario 1 – Wi-Fi Issue

Test Input

Caller: Enter one Caller Name

Short Description:

```
WiFi not working in library
```

The ticket is then saved and the form is reloaded.

Expected Result

The system should automatically assign:

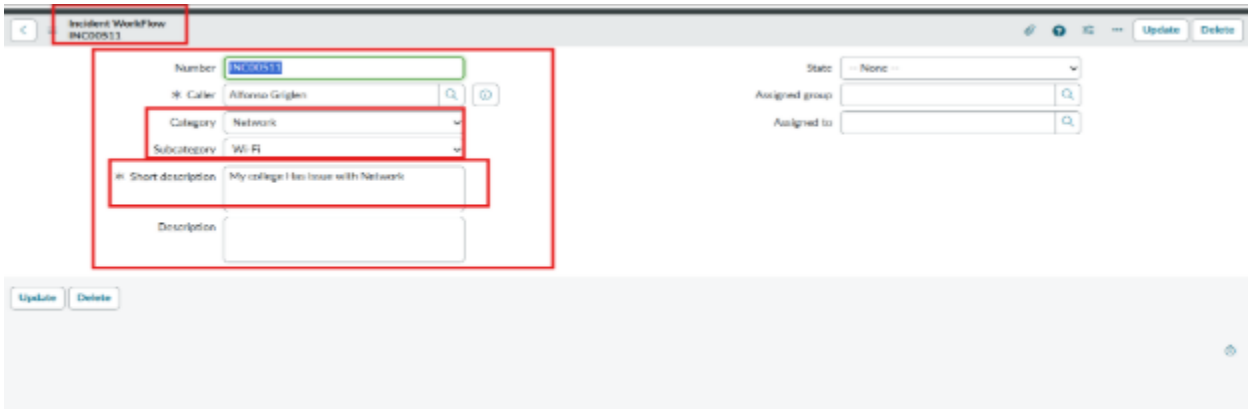

Category: Network

Subcategory: WiFi

The system should also send an email to the caller's email ID.

Test Result

Status: Pass / To be verified during actual testing

5. Test Scenario 2 – Projector Issue

Test Input

Caller: Enter one Caller Name

Short Description:

```
Projector not turning on
```

The ticket is then saved and the form is reloaded.

Expected Result

The system should automatically assign:

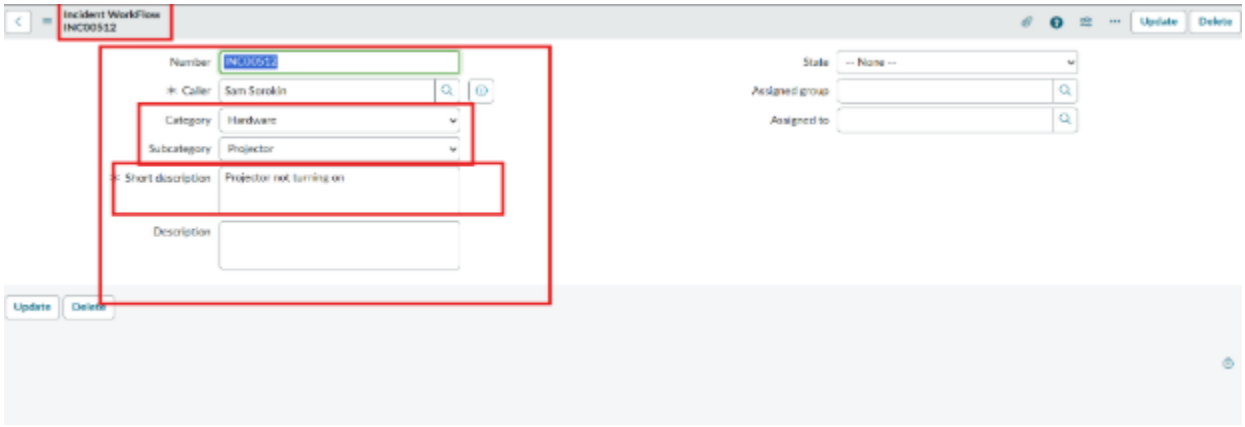

Category: Hardware

Subcategory: Projector

The system should also send an email to the caller's email ID.

Test Result

Status: Pass / To be verified during actual testing

6. Email Notification Testing

After creating a ticket, the email notification can be checked through:

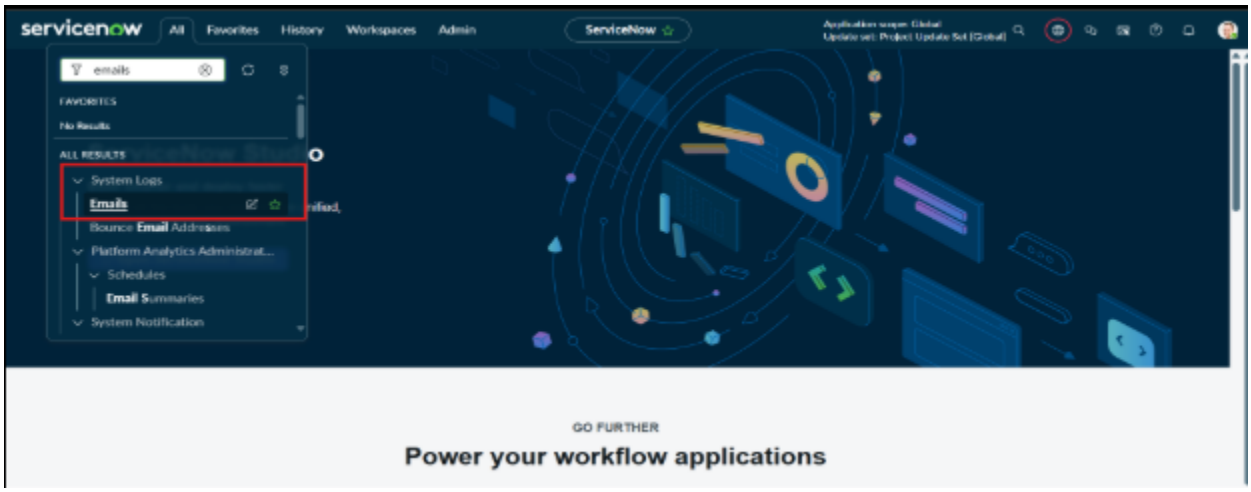

All → Search Emails → System Logs → Emails

The email record can be searched using the specified subject name.

The email record can then be opened and the **Preview mail** option can be used to check the notification.

Expected Result

The caller should receive an email notification confirming that the request has been submitted.

---

7. Testing Summary

Test Scenario	Input	Expected Category	Expected Subcategory	Email
Test 1	WiFi not working in library	Network	WiFi	Yes
Test 2	Projector not turning on	Hardware	Projector	Yes

The project document specifically provides these two testing scenarios for validation.

---

8. Validation of Automation

The testing process validates that:

Ticket Created
↓
Short Description Checked
↓
Issue Identified
↓
Category Automatically Assigned
↓
Subcategory Automatically Assigned
↓
Email Notification Sent

This confirms the expected end-to-end automation flow.

---

9. Security and Access Considerations

The project testing phase also considers basic security and access control practices.

The project document states that the phase should ensure that only authorized users can access or modify ticket data.

---

10. Overall Testing Outcome

The testing phase is designed to confirm that the developed solution:

- Creates ticket records correctly.
- Generates unique auto-numbers.
- Automatically assigns Category.
- Automatically assigns Subcategory.
- Stores ticket information accurately.
- Resolves reference fields correctly.
- Sends email notifications to callers.
- Performs the expected automatic classification.

11. Conclusion

The Project Testing phase validates the functionality of the **Auto Ticket Classification using Flow Designer** project.

Wi-Fi and Projector test scenarios are used to verify automatic classification and email notification. Data validation checks are also performed to ensure that ticket information is stored correctly.

Successful testing will provide the basis for completing the **Project Documentation and Demonstration phases**.
