PHASE 7 – PROJECT DOCUMENTATION

Project Title

Auto Ticket Classification using Flow Designer

---

1. Introduction

The Project Documentation phase is used to organize and finalize the documentation of the **Auto Ticket Classification using Flow Designer** project.

This phase ensures that the developed solution is properly documented and that the project information is available for future reference. The supplied project material describes this stage as the final documentation and deployment stage, intended to make the solution stable, reusable, and ready for demonstration or production use.

---

2. Purpose of Documentation

The main purposes of project documentation are:

1. To maintain a complete record of the project.
2. To describe the problem and proposed solution.
3. To document the requirements of the system.
4. To document the system design.
5. To record the development activities.
6. To record the testing and validation activities.
7. To provide information about deployment.
8. To provide a reference for future maintenance and improvements.

---

3. Project Information

Project Name

Auto Ticket Classification using Flow Designer

Platform

ServiceNow

Main Technology

Flow Designer

Application

Global

Main Purpose

To automatically classify school IT support tickets based on the short description provided by the user.

---

4. Project Problem

The school IT helpdesk receives different types of support requests, including Wi-Fi, projector, password, and computer-related issues.

Manual classification of these tickets requires IT staff to review the requests and select the appropriate Category and Subcategory.

The project provides an automated approach to reduce this manual effort.

---

5. Proposed Solution

The project uses **ServiceNow Flow Designer** to automatically classify IT tickets.

The system checks the Short Description for predefined issue information and automatically assigns the appropriate Category and Subcategory.

The solution also uses dependent choices and sends an email notification to the caller after ticket creation.

---

6. Main Project Components

The main components documented in this project are:

6.1 Update Set

Project Update Set

The Update Set is used to organize the project configuration.

6.2 Custom Table

Incident WorkFlow

This table stores the ticket records.

6.3 Ticket Fields

The project includes:

- Number
- Caller
- Category
- Subcategory
- Short Description
- Description
- State
- Assigned Group
- Assigned to

6.4 Dependent Choices

The Subcategory field is dependent on Category.

The documented relationships are:

Category	Subcategory
Network	Wi-Fi
Hardware	Projector
Access	Forgot password
Performance	Slow computer

6.5 Flow Designer

The automation flow is named:

Auto Classify School IT Tickets

It uses a **Record Created** trigger and checks the ticket information for automatic classification.

---

7. Automatic Classification

The documented classification logic is:

Issue	Category	Subcategory
Wi-Fi / Network	Network	Wi-Fi
Projector	Hardware	Projector
Forgot password	Access	Forgot Password
Slow Computer	Performance	Slow computer

The Flow Designer updates the ticket record according to the identified issue.

---

8. Email Notification

The project includes an automated email notification.

Email Configuration

To: Caller → Email

Subject:

```
Your Request for the issue has been submitted.
```

Body:

Ticket confirmation message.

This notification is intended to confirm ticket creation to the caller.

---

9. Testing Documentation

The project includes testing and validation activities.

Test Scenario 1

Input:

```
WiFi not working in library
```

Expected Result:

Category → Network

Subcategory → WiFi

Email → Sent to caller

Test Scenario 2

Input:

```
Projector not turning on
```

Expected Result:

Category → Hardware

Subcategory → Projector

Email → Sent to caller

These test scenarios are specified in the supplied project document.

---

10. Data Validation Documentation

The following validation checks are included:

- Mandatory fields are captured correctly.
- Auto-number is generated without duplication.
- Category and Subcategory values are stored accurately.
- Reference fields resolve correctly to user and group tables.

---

11. Deployment Documentation

After development and testing, the **Project Update Set** is changed from **In progress** to **Complete**.

The completed Update Set is then exported to XML using the **Export to XML** option.

This provides a deployable copy of the project configuration.

---

12. Project Benefits

The documented project provides the following benefits:

- Reduces manual effort in ticket categorization.
- Improves consistency in ticket classification.
- Automatically assigns Category and Subcategory.
- Provides automated caller notification.
- Uses a no-code Flow Designer implementation.
- Supports maintainability and scalability.
- Helps improve the efficiency of the school IT helpdesk.

---

13. Future Enhancement

The project documentation identifies possible future extensions, including:

- Assignment automation
- SLA tracking
- Predictive intelligence

The supplied project material states that the current design can be extended with these advanced features in the future.

---

14. Final Project Summary

The **Auto Ticket Classification using Flow Designer** project provides an end-to-end automation solution for a school IT helpdesk.

The system uses structured ticket information, dependent choices, Flow Designer automation, and email notifications to automatically classify IT support tickets.

The project follows a phased approach covering requirements, design, development, testing, deployment, and documentation.

---

15. Conclusion

The Project Documentation phase brings together the important information related to the **Auto Ticket Classification using Flow Designer** project.

The documentation records the project requirements, design, development, testing, validation, deployment, benefits, and possible future enhancements.

The completed documentation provides a clear reference for understanding and maintaining the project and prepares the project for the final **Project Demonstration phase**.
