PHASE 8 – PROJECT DEMONSTRATION

You can create this as a **separate Word/Google Docs file**. You do **not** need to add the screenshots now. We can add the important screenshots later after you share your project demonstration video.

Project Title

Auto Ticket Classification using Flow Designer

---

1. Introduction

The Project Demonstration phase presents the completed **Auto Ticket Classification using Flow Designer** project.

The project demonstrates how a school IT helpdesk can automate the classification of IT support tickets. When a ticket is created with a short description, the Flow Designer automation identifies the issue and automatically assigns the appropriate **Category** and **Subcategory**.

The demonstration also shows the email notification sent to the caller after the ticket is created.

---

2. Purpose of the Demonstration

The purpose of the demonstration is to show that the developed solution:

- Creates and manages IT helpdesk tickets.
- Captures the required ticket information.
- Automatically classifies tickets based on the short description.
- Assigns the appropriate Category and Subcategory.
- Uses dependent choices for accurate data selection.
- Sends an email notification to the caller.
- Provides a structured and maintainable no-code automation solution.

---

3. Project Name

Auto Ticket Classification using Flow Designer

---

4. Project Purpose

The purpose of the project is to reduce the manual effort required by IT staff to categorize school IT helpdesk incidents.

The system uses **Flow Designer** to automatically classify tickets based on predefined keywords in the Short Description.

---

5. Project Benefits

The developed solution provides the following benefits:

1. Reduces manual ticket categorization.
2. Improves ticket routing.
3. Provides consistent classification.
4. Improves data accuracy through dependent choices.
5. Sends automatic email notifications to callers.
6. Uses a no-code Flow Designer solution.
7. Provides a maintainable and scalable approach.
8. Improves the efficiency of the school IT helpdesk process.

---

6. Demonstration Requirements

The demonstration video should show the working project and explain:

- Project name
- Project purpose
- Project benefits
- Working process
- Final output

The demonstration should include a voice-over explaining the project while showing the project screen.

---

7. Demonstration Flow

The project demonstration can be performed in the following order.

Step 1 – Introduce the Project

Start the demonstration by introducing the project:

Project Name:
Auto Ticket Classification using Flow Designer

Explain that the project is designed for a school IT helpdesk to automatically classify incidents.

Step 2 – Show the Custom Table

Open the **Incident Workflow** table and show the configured ticket fields.

The demonstration should show fields such as:

- Number
- Caller
- Category
- Subcategory
- Short Description
- Description
- State
- Assigned Group
- Assigned to

Step 3 – Explain the Ticket Classification

Explain that the user does not need to manually select the Category and Subcategory when creating the ticket.

The Flow Designer checks the Short Description and performs the classification.

The project classification is:

Short Description / Issue	Category	Subcategory
Wi-Fi / Network issue	Network	Wi-Fi

Projector issue	Hardware	Projector
Forgot password / Login issue	Access	Forgot Password
Slow computer / Hanging issue	Performance	Slow Computer

Step 4 – Demonstrate Wi-Fi Ticket

Create a new ticket.

Enter a caller and use the Short Description:

WiFi not working in library

Save the ticket.

After the Flow Designer automation runs, show that:

- **Category:** Network
- **Subcategory:** Wi-Fi

This demonstrates automatic classification.

Step 5 – Demonstrate Projector Ticket

Create another ticket.

Use the Short Description:

Projector not turning on

Save the ticket.

Show that the system automatically assigns:

- **Category:** Hardware
- **Subcategory:** Projector

Step 6 – Demonstrate Email Notification

After creating the ticket, demonstrate that an email notification is generated for the caller.

The project uses the email subject:

Your Request for the issue has been submitted.

The email confirms that the request has been submitted.

Step 7 – Show the Flow Designer

Open the Flow Designer and show the flow:

Auto Classify School IT Tickets

Explain that the flow is triggered when a record is created and the Category is empty.

The flow then checks the Short Description and performs the appropriate classification.

Step 8 – Explain the Complete Working Process

The complete working process can be explained as:

User creates ticket
↓
Caller and Short Description are entered
↓
Record is created
↓
Flow Designer is triggered
↓
Short Description is checked
↓
Issue is identified
↓
Category and Subcategory are automatically assigned
↓
Email notification is sent to Caller
↓
Classified ticket is available

---

8. Final Output

The final output of the project is an automated school IT helpdesk ticket classification system.

The system automatically identifies common IT issues and assigns the corresponding Category and Subcategory.

It also sends an email notification to the caller after the ticket is submitted.

---

9. Demonstration Video

The complete project demonstration video will be uploaded to **Google Drive**.

---

10. Demonstration Outcome

The demonstration verifies the complete working process of the **Auto Ticket Classification using Flow Designer** project.

The demonstration shows that tickets can be created and automatically classified based on their Short Description. It also demonstrates the dependent choice configuration, Flow Designer automation, and email notification.

---

11. Conclusion

The project demonstration presents the completed end-to-end school IT helpdesk automation solution.

The demonstration shows how Flow Designer reduces manual categorization, improves classification consistency, supports accurate ticket data, and provides email communication to the caller.

The completed solution provides a structured, maintainable, and scalable approach for automating school IT helpdesk ticket classification.
